Participant Guide – Webinar “Excel Tariff Calculator → Python”

Preparation goals and your time budget

> **The only goal** of the preparation: run `pytest -q` and see **all tests green** (**“11 passed”**).
> **Important:** We will explain navigation in the program and the functions **during the webinar**.
> **Your time budget:** 29 min setup (account + start), 1 min project test.

Participation formats

Prerequisites are ordered by the amount of setup effort required and the added value during the webinar.

Type	Role	Required programs / accounts
A – Listener	Just watch	*No installation required*
B – Codespaces in the browser	Work in the browser	1. GitHub account 2. LLM access with 120–150k tokens (at least comparable to an OpenAI ChatGPT Plus subscription)
C – Docker + VS Code Desktop	Work locally	1. Docker Desktop (Win/macOS/Linux) 2. Visual Studio Code with Dev Containers extension 3. Git (Git for Windows / Homebrew / apt) 4. LLM access with 120–150k tokens (at least comparable to an OpenAI ChatGPT Plus subscription)

> **Important note:** For interactive work (formats B and C), access to an LLM model with 120–150k tokens (at least comparable to an OpenAI ChatGPT Plus subscription) is required.

B – GitHub Codespaces (browser IDE)

0. Create a GitHub account or log in (including email verification).

1. Open the repository **https://github.com/bartlmac/portxlpy-seminar-2026-02-eaa**
2. On the right side:
   - Green menu button `<> Code`
   - Select the **Codespaces** tab
   - Green button `Create codespace on main`.
3. After it starts, the VS Code web IDE opens.
4. Open the terminal and run e.g.:

```
pytest -q
python Bartek/output/run_calc.py --help
```

C – Local setup (Docker Desktop + VS Code)

1 · Install software

Tool	URL
Docker Desktop	https://docs.docker.com/get-docker/
Visual Studio Code	https://code.visualstudio.com/
Dev Containers extension	VS Code Marketplace, see note below
Git	https://git-scm.com/downloads

Notes:

> Docker uses Linux containers by default; usually you don't have to do anything else — however, if Windows asks you to install or update Windows Subsystem for Linux (WSL 2), confirm and perform the update.

> **Find the Dev Containers extension**
>
> - Open VS Code.
> - **Extensions** (left sidebar, building-block icon) or **Ctrl+Shift+X** (Windows) / **Cmd+Shift+X** (macOS).
> - Search for **"Dev Containers"** → install (Publisher: **Microsoft**).
> - **Marketplace ID**: `ms-vscode-remote.remote-containers`

2 · Set up the project

2.1 Open PowerShell oder Terminal

2.2 Switch to your project directory (example):

```
# Windows (PowerShell)
cd C:\dev\git
# macOS / Linux (Terminal)
cd ~/dev/git
```

2.3 Clone the repo, go to the root, start VS Code:

```
git clone https://github.com/bartlmac/portxlpy-seminar-2026-02-eaa.git
cd portxlpy-seminar-2026-02-eaa
code .
```

2.4 In VS Code, run “Reopen in Container”

Standard method (Command Palette):

- Press **F1** (or **Ctrl+Shift+P** / **Cmd+Shift+P**) or alternatively type a `>` as the first character in the search field (usually at the top); VS Code will open the Command Palette
- Type and select **“Dev Containers: Reopen in Container”**

2.5 Smoke test

If the test does not run automatically, open the VS Code terminal (**Menu: Terminal** → **New Terminal**) and enter:

```
pytest -q
```

Expected: `11 passed`
