european actuarial academy

The European knowledge centre for actuaries

Setup & Toolchain

Bartlomiej Maciaga
Dr. Arno Rasch

9 February 2026 | 9:30-12:45 CET | online

What Do We Need?

Everything prepared – no installation needed during the session.

VS Code

Desktop or browser via port forwarding

GitHub Account

For setup via GitHub Codespaces, free

LLM Access

An LLM license and app, usually a paid version needed

Quick Start in 3 Simple Steps

1 Git Hub Login

Create or log in to a GitHub account. It’s free of charge and a must for a developer.

2 Run Codespaces

Open repository → "Create Codespace on main“. Automatic start in VS Code Web-IDE. Wait for the build process to end.

3 Execute `pytest -q`

If not automatically done, execute the tests to verify the setup. Expected: 11 tests passed. That’s it!

Advanced Alternative: Use Local VS Code Environment

For users who wish to work offline, here is the alternative method:

Docker Desktop

For container virtualization on your system.

VS Code

As your preferred integrated development environment (IDE).

Dev Containers Extension

Extends VS Code with support for development containers.

Git

For version control and cloning the repository.

VS Code Setup: Start Locally in 4 Steps

1 Clone

If not already done: Clone the repository to your local system (see participant guide).

2 Reopen in Container

Open the project in VS Code in a development container. A build-process starts, if not completed yet.

3 Open Terminal

Start the integrated terminal in VS Code – bash or powershell, your choice.

4 Execute `pytest -q`

Execute the tests to verify the setup. Expected: 11 tests passed. That’s it!
